

Wood as a Construction Material

Source: Britannica Images

Wood has great potential as a construction material due to its robustness, light weight, eco-friendly attributes and capabilities of being prefabricated for building applications (Wimmers, 2017). Today Europe is “leading the way in tall timber projects”, found in a study by the Council on Tall Buildings and Urban Habitat (CTBUH, 2017). In this reading list, we look at the timber construction market, analysis of wooden materials, timber prefabrication possibilities, environmental advantages of wood-based buildings, and recent developments in wooden architecture.

The list contains over 40 resources mostly published within the past 5 years and aims to offer insights from various reliable sources, including associations, journals, book titles, and more.

The Library will periodically add new resources to this list. Links to the full-text are indicated. If you encounter any problem in retrieving the materials, please contact library@sutd.edu.sg for assistance. Please also forward us titles that you would like to share with others in this list.

Topics

- Overview
- Market Analysis & Outlook
- Material Assessment
- Prefabrication
- Sustainability
- Wooden Architecture

Overview

Providing a general idea of wood construction, how the system works, use of the material, possibilities and challenges
